**REASON FOR ALLOWANCE**

1. Rolla discloses a tire reinforcing arrangement comprising an internal support member associated with the inner rim member. The internal support member includes an outer peripheral surface having an annular groove with the groove having a transverse passageway to permit a tire to be mounted onto the rim member. Glinz et al and Shimura et al disclose various types of tire reinforcing arrangement comprising an outer tire, an annular spare tire set inside the outer tire comprising a plurality of ridges, a locking clamp extending between the walls of the spare tire. Chang discloses a safety liner for protecting a tubeless tire which is combined with a predetermined number of segment of identical shape to form a circular configuration for disposing in place into the drop center of a tire rim and adjustably locked up by a coupling member at the ends. A wedge plate slidably secures between each segment and the drop center at one side and a cushion runner disposes between the circular configuration and the drop center at the other side. However, none of the references of record suggests a tire reinforcing arrangement wherein a plurality of stretchers are respectively stopped between annular spare tires, said stretchers each having two end lugs respectively stopped against said annular spare tires, a U-shaped middle pad and a rubber is bonded to said U-shaped middle part in the manner defined in the instant claim 1 and in combination with other limitations of the claim.
